Electronystagmography (ENG) is a test used to evaluate vertigo and certain other hearing and vision disorders. For this test, electrodes are placed above and below the eye. They record the electrical ...

Electronystagmography (ENG) and videonystagmography (VNG) are eye movement recording methods used for the evaluation of balance disorders. Aim: To compare literature information on the ...

ive manner is use of video infra-red recording goggles. Direct infrared oculography involves an array of tiny infrared lights reflected off the surface of the eye and uses the differential reflectio between the ...

Results: ENG and VNG are very helpful methods for evaluating balance disorders, due to their capacity to recognize signs of peripheral or central vestibular dysfunction and to pinpoint the side of the lesion.

Electronystagmography is defined as the recording of corneo-retinal potentials to confirm the presence of nystagmus, involving the placement of electrodes around the eyes to assess eye movement ...

Electronystagmography accurately records eye movements and nystagmus after certain provocative maneuvers. To perform this test, disc electrodes are placed over the bridge of the nose and lateral to ...

Electronystagmography (ENG) measures normal eye movement and involuntary rapid eye movements called

nystagmus. It also checks the muscles that control eye movements.

By measuring the changes in the electrical field within the eye, ENG can detect nystagmus (involuntary rapid eye movement) in response to various stimuli. If nystagmus does not occur on stimulation, a ...
