

Paraguayan Transimpedance Amplifier Upgrade vs Copper Cable

The best hookup wire depends on the application. Use wire which is thick enough to cope with the current, even when under a hot chassis. Insulation should be thick enough to cope with the ...

In this blog, I will produce actual test results that demonstrate the abject failure of CCA "communications cable" to live up the claim of being a less expensive yet a valid alternative. Take a ...

The two ends of the cable are simple cable connectors, which is the lowest cost high-speed interconnection solution. Due to the physical performance limitations of copper, the DAC ...

I generally believe cable don't make as much difference as anything else. If so very minimal difference. I've used the kef r300 with a roksan k3 and cxn v2 as my streamer and always found the midrange ...

A transimpedance amplifier (TIA) converts a current to a voltage and is often used with current-based sensors like photodiodes. It's also a common building block that helps explain the performance and ...

Finding an op amp with both low current noise and low voltage noise can be challenging. Input capacitance also limits bandwidth. One way to think about this is to consider the impedance of the ...

Oftentimes, audio cables will range anywhere from 10AWG to 28AWG (the higher the AWG, the thinner the wire). The thickness and length of the copper wire affects its electrical ...

TIAs are conceptually simple: a feedback resistor (RF) across an operational amplifier (op amp) converts the current (I) to a voltage (VOUT) using Ohm's law, $V_{OUT} = I \cdot R_F$. In this series of blog posts, I will ...

I can't tell you how to upgrade your power cables but I can tell you it made a significant improvement in my system when I ditched those silly basic cables.

This uses 14awg copper conductors insulated in Teflon. Then it adds a massive filter that attempts to mitigate the standing wave ratio to as close to 1:1 as possible.
