

Will making optical modules cause asthenospermia

Asthenospermia and mitochondrial dysfunction may be related in some circumstances. To fully understand the ramifications of these results for possible medicinal applications, more research is...

Perhaps, it can lead to asthenozoospermic samples having numerous motile sperm since the light exposure and therefore asthenozoospermic samples may have more motile sperm by triggering the ...

Here we describe CFAP45 deficiency in man and mouse that causes a motile ciliopathy featuring LRA abnormalities (situs inversus totalis, heterotaxy) as well as asthenospermia.

Low-level laser light exposure appears to have a positive short-term effect on the motility of treated spermatozoa and did not cause any increase in ...

Causes of complete asthenozoospermia include metabolic deficiencies, ultrastructural abnormalities of the sperm flagellum (see Primary ciliary dyskinesia) and necrozoospermia.

Asthenozoospermia, a type of male infertility, is primarily caused by dysfunctional sperm mitochondria.

Here, we first found that the loss of KNL1 caused oligospermia and asthenia in mice and detected the abnormal composition of different ploidy sperm cells by FCM.

Here, we describe a deficiency of cilia and flagella associated protein 45 (CFAP45) in humans and mice that presents a motile ciliopathy featuring situs inversus totalis and asthenospermia.

Here we describe CFAP45 deficiency in man and mouse that causes a motile ciliopathy featuring LRA abnormalities (situs inversus totalis, heterotaxy) as well ...

Low-level laser light exposure appears to have a positive short-term effect on the motility of treated spermatozoa and did not cause any increase in DNA damage measured at 2 hours. We ...
